CS 362 In-Class Exercise 4: Project Beta Testing

Your name: Samuel Vernick

Project team number that you are testing (e.g., team 1): 9

PART-1: Organization and Purpose (2 pts)

Q1) Does the repository provide a README explaining the purpose of the software? If yes, based on reading that documentation, do you understand all the interesting features provided by the software? Do you have any advice to improve that documentation?

The README does exist and provides good instructions on installing and understanding how to use the software. The table of contents is partially functional, with the “Usage” item not working as intended as it does not redirect you to that section of the README. I don’t fully understand the limitations of the software, is it required to import an entire iphone backup? It seems that way as the only use case listed, but I'd love to have the option to select fewer items.

My understanding of the software from reading the documentation: A tool that extracts images from an iphone backup and creates a formatted, readable and usable version.

One more piece of advice. It was not initially obvious from reading the README that there was more documentation, I would recommend adding a link to the documentation folder within the README.

PART-2: Installation and Setup (1 pts)

Q2) Is the documentation to install or setup the software available? (Note that for a web application, it would be a URL to access the website and instructions to host the website on a server). When following the instructions, do you face any difficulties while installing the software (accessing the URL for a website)? If yes, please explicitly state what issues you encountered, so that the project team can fix them.
NOTE: If you are testing a web application, then you do not need to set up a web server and try hosting the web application. Just go through the documentation to find out if it clearly explains the steps to host the website.

The documentation is available for installing and running the software. I faced a brief error as I have python3 and not python on my machine (maybe clarify that?) but beyond that it was a smooth install.

PART-3: Functional and Non-Functional Testing (2 pts)

Q3) Select a use case for the application-under-test and use your creativity to test the application in different possible ways. For example, if you are testing a login functionality, then test the sign up feature, sign in, adding invalid credentials, special characters, etc. Please provide the details of the use case you tested on the software by describing exactly what all you did and in what order? Make sure you are making notes while doing this. If you find any issues (e.g., something that was confusing, incorrect, or not working at all), please provide as many details as you can to replicate the issues so that the team can fix them.

I did not have an iphone backup to load and test, but all the other features of the website I tested. I tried to act as a user learning about the website after downloading, using the Photo Descriptor (beta) and accessing the documentation. The photo descriptor worked fine, and popped out a photo from the selected category, however the descriptions provided were inaccurate. I'm sure this is just an issue with whatever model was used to generate the descriptions, and it seems like a minor feature alongside the primary goal so I wasn't too bothered:

1. Load iPhone Backup Folder
2. Export All Camera Roll Media
3. Export Specific Camera Roll Media
4. Settings
5. Help
6. Report Bug
7. Photo Descriptor (Beta Demo)
8. Restart
9. Exit

1. outside_pics
2. random_pics
3. Back

1. sample_1.jpeg
2. sample_3.jpeg
3. sample_2.jpeg
4. Back

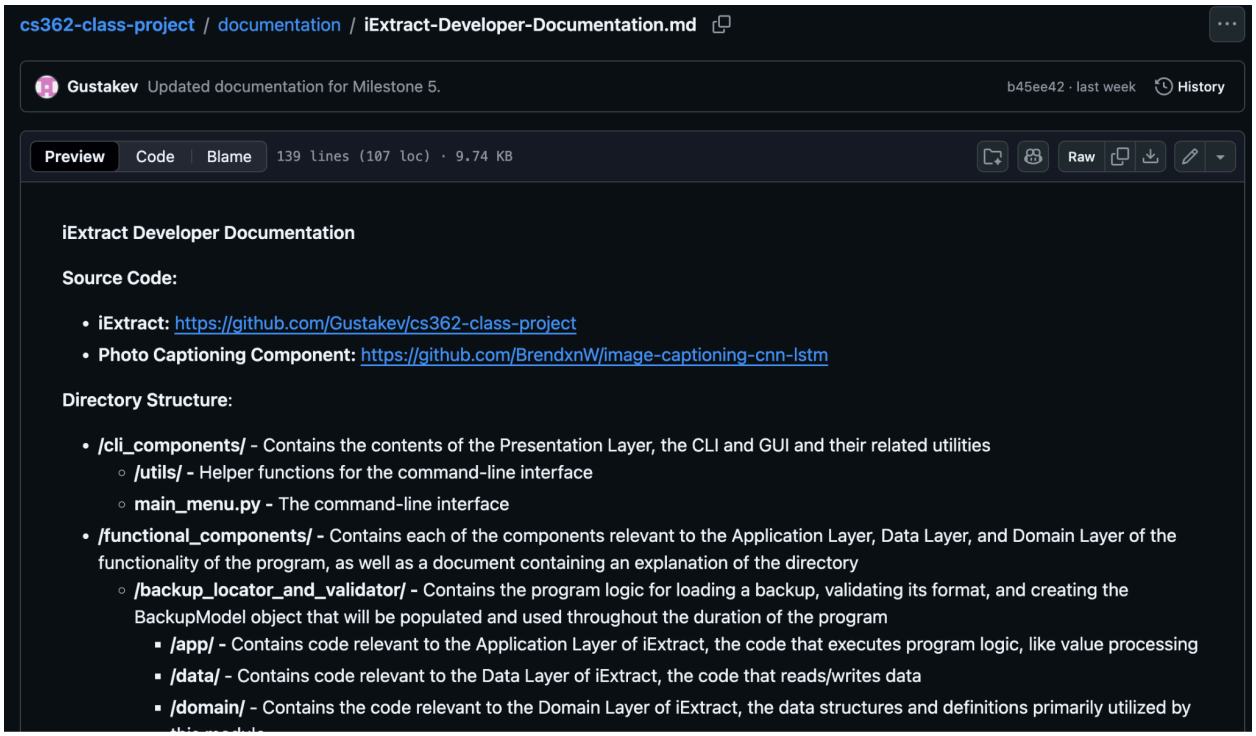
Choice: 3
Loading...

Caption: a picture of a giraffe and some animals in the side of an elephant in the water from it s out of a man on the water

One easy issue to fix, the documentation links were swapped, as trying to access the user documentation led me to developer documentation and vice versa:

1. Load iPhone Backup Folder
2. Export All Camera Roll Media
3. Export Specific Camera Roll Media
4. Settings
5. Help
6. Report Bug
7. Photo Descriptor (Beta Demo)
8. Restart
9. Exit

1. User Documentation
2. Developer Documentation
3. Back



I also tested importing files that didn't exist, that weren't valid backups, and that were empty, all of which were correctly rejected!
