CS 362 In-Class Exercise 4: Project Beta Testing

Your name: Beck Johnson

Project team number that you are testing (e.g., team 1): Team 9

PART-1: Organization and Purpose (2 pts)

Q1) Does the repository provide a README explaining the purpose of the software? If yes, based on reading that documentation, do you understand all the interesting features provided by the software? Do you have any advice to improve that documentation?

README is provided and sufficiently explains the features and use cases of the product.

PART-2: Installation and Setup (1 pts)

Q2) Is the documentation to install or setup the software available? (Note that for a web application, it would be a URL to access the website and instructions to host the website on a server). When following the instructions, do you face any difficulties while installing the software (accessing the URL for a website)? If yes, please explicitly state what issues you encountered, so that the project team can fix them.
NOTE: If you are testing a web application, then you do not need to set up a web server and try hosting the web application. Just go through the documentation to find out if it clearly explains the steps to host the website.

ON MAC. No obvious issues encountered when installing. The only possible issue is that the .venv folder is never created when running, only a venv folder (no ‘ . ’). This doesn’t affect the program but may mean that my global python virtual environment is being changed. Again, this didn’t affect the running of the program and everything seems to be initially working.

PART-3: Functional and Non-Functional Testing (2 pts)

Q3) Select a use case for the application-under-test and use your creativity to test the application in different possible ways. For example, if you are testing a login functionality, then test the sign up feature, sign in, adding invalid credentials, special characters, etc. Please provide the details of the use case you tested on the software by describing exactly what all you did and in what order? Make sure you are making notes while doing this. If you find any issues (e.g., something that was confusing, incorrect, or not working at all), please provide as many details as you can to replicate the issues so that the team can fix them.

ON MAC

ISSUE 1

When using the photo descriptor functionality on sample_1.jpg in the outside_pics folder I got this output and a crash after a few seconds of inactivity:

```
** Instructions: Enter a number corresponding to the choices below. **

1. outside_pics
2. random_pics
3. Back

Choice: 1
1. sample_1.jpg
2. Back

Choice: 1

```

I'm leaving this issue in but it started working after I immediately re-launched the program. One of my groupmates also encountered this issue.

ISSUE 2:
More a preference/usability thing, but when I am backing out of multiple menus it was slightly annoying to adjust which number I pressed to back out. Maybe consider a universal exit/back button (i.e. e, q, check for escape keystrokes)

ISSUE 3:
When selecting the "1. Load iPhone Backup Folder Via GUI" option the finder window opens behind my CLI window which made it seem like the program was broken. Also the program just hangs when the window is open so I had no way of knowing that a window opened. Maybe find a way to print a message or just make that window open in front of the CLI].
